Curtain Solutions

SKOV-SECCO curtain solutions are an integrated and vital part of a natural ventilation system for dairy barns. We offer a range of solutions, including roll-up, roll-down, single, and double curtains, that we optimized for the specific barns. The curtain materials are available in gray, green, transparent, and perforated black and green. While the cover materials come in gray, green, and transparent. The maximum allowable opening height is 4500 mm.

Natural ventilation: Barn curtains allow fresh air to circulate through the barn. By adjusting the curtains, farmers can minimize the use of recirculation fans and save energy. Proper ventilation minimizes dust, mold, and airborne diseases, promoting better animal health and productivity.

Flexible climate control: The curtain solutions offer high flexibility regardless of the season or climate. Farmers can open or close them as needed to regulate airflow and temperature. This adaptability ensures optimal conditions for livestock.

Cost-effective solution: Investing in SKOV-SECCO curtains is a long-term choice. While upfront costs may vary, the benefits, such as energy savings, improved health, and enhanced productivity, outweigh the initial investment.

Insulation and weather protection: When closed, quality curtains shield animals from harsh weather and wind. The PES curtain with PVC coating weighs 680 g/m². It is used when you want to hinder the wind and drafts. Meanwhile, the 280 g/m² perforated curtain provides a gentle breeze in the barn without causing drafts.

Light Control: Barn curtains come in various colors, translucent curtains allow more natural light during the day, while darker or blackout curtains keep the barn darker regardless of the time. This flexibility enables farmers to create an ideal animal environment and enhance productivity.

In a SKOV-SECCO ventilation system, the curtains are automatically regulated by the BlueControl controller, and it comes equipped with software designed exclusively for dairy production. Along with other ventilation components in the barn, the BlueControl controller ensures optimal climate conditions for animal welfare and high productivity.

Double Roll-Down with Pulleys (TFPD)

The double roll-down curtain with pulleys can be opened from the top, ensuring optimal ventilation and preventing drafts in the barn.

Single Roll-Down with Pulleys (TFPS)

The single roll-down curtain with pulleys has a variable opening from the top. The seamless opening ensures optimum ventilation without drafts in the barn.

Double Roll-Down with Shafts (TFSD)

The double curtain with center winding opens from the top via a cable drum unit mounted on a shaft. The variable opening from the top and downward provides optimal ventilation without drafts in the barn.

Single Roll-Up (BCS)

The single curtain has a variable opening from the bottom using a climbing motor and telescopic pulling arm. Both single roll-up and double roll-up curtains can be used as sidewall curtains that allow and regulate the air into the barn, for the gable ends of a barn, and as baffles to increase air velocity, which also redirects airflow in cross-ventilated barns.

Single Roll-Down with Shafts (TFSS)

The single curtain with center winding opens from the top via a cable drum unit mounted on a shaft. The variable opening from the top, going downward, provides optimal ventilation without drafts in the barn.

Double Roll-Up (BFD)

The double curtain has a variable opening from below.
