SECCO ELITE DAIRY

VENTILATION PROGRAM

Management module

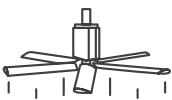

The DOL 434 climate controller provides fully integrated management of the environmental conditions with remote access, THI reading, and intuitive touch screen applications.

Natural ventilation module

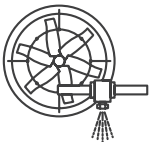

The unique integrated system, including the ISOCELL™ membranes and our Lumiridge with chimneys, provides adapted optimal conditions for dairy production in continental climates.

Mechanical ventilation module

Our integrated, highly efficient system, including Big Air PÜRÉ ceiling fans, supply the needed constant airflow to assist in maintaining sufficient daily dry matter intake.

Complementary cooling module

The complementary misting regulation system provides an effective and integrated option for cooling assistance, which effectively preventing milk production decrease due to heat stress.

This unique and fully integrated **ELITE PROGRAM** gathers all the parameters needed to achieve optimal environmental conditions for highly productive dairy cows. The high-tech modules which are part of the program allow a simple, efficient, and preventive management process. The on-screen data is user-friendly, multilingual, and facilitates remote access and climate regulation.

As leaders in ventilation for dairy production, our mission is to export our unique technologies and knowledge to ensure the growth of the worldwide production of high-quality milk available to all families globally. We have the capacity and the obligation to create sound environmental conditions to make dairy production farms more profitable and eco-responsible.
