

BF 50 TUNNEL VENTILATION

- Minimum energy consumption with a high airflow ratio
- Direct driven fans - meaning that no adjustment and maintenance of belts are needed
- Long durability with separated motor and controller
- Non-corrosive materials
- Air-controlled shutter system - easy to install

BF 50 TUNNEL VENTILATION BENEFITS

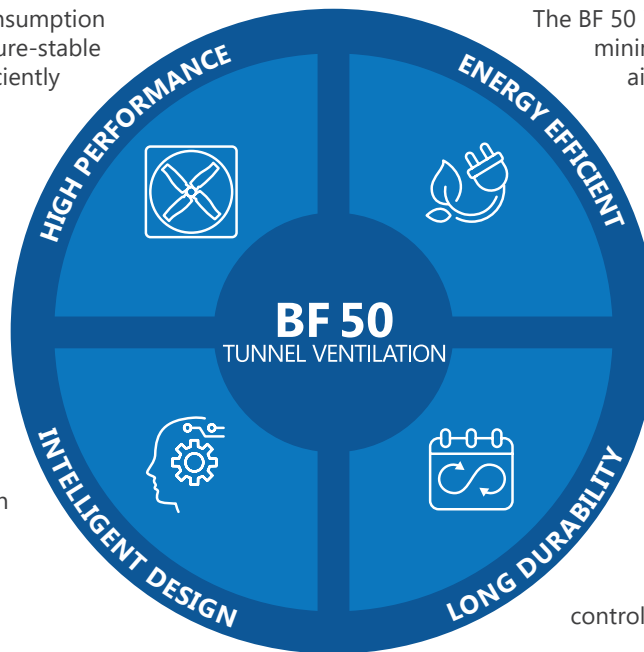

The BF 50 is ideal for tunnel ventilated barns as well as in combi-tunnel for side mode and tunnel mode ventilation.

It combines a minimum energy consumption with a high airflow ratio. The pressure-stable design enables the fans to run efficiently and always ensures the optimum climate conditions in the barns.

The BF 50 is very energy-efficient and ensures a minimum energy consumption to exhaust air from the barns. The pressure-stable design ensures that the fans run optimally, also in windy weather.

The airtight shutters have a high degree of insulation, which prevents drafts and minimizes condensation when the fan is not in operation.

The BF 50 is made of thermoplastics and stainless steel, so it stands in the harsh environment in the barns. The fan has direct-driven wings, which means that no adjustment and maintenance of belts are needed. The motor and controller are separated, making service and replacement less expensive.
